

Machine Learning Presentation

A Data Science Bootcamp Capstone Project
by Russell Kua (28 Apr 2023)

A dark blue diagonal gradient bar that starts from the bottom left and extends towards the top right, covering the lower half of the slide.

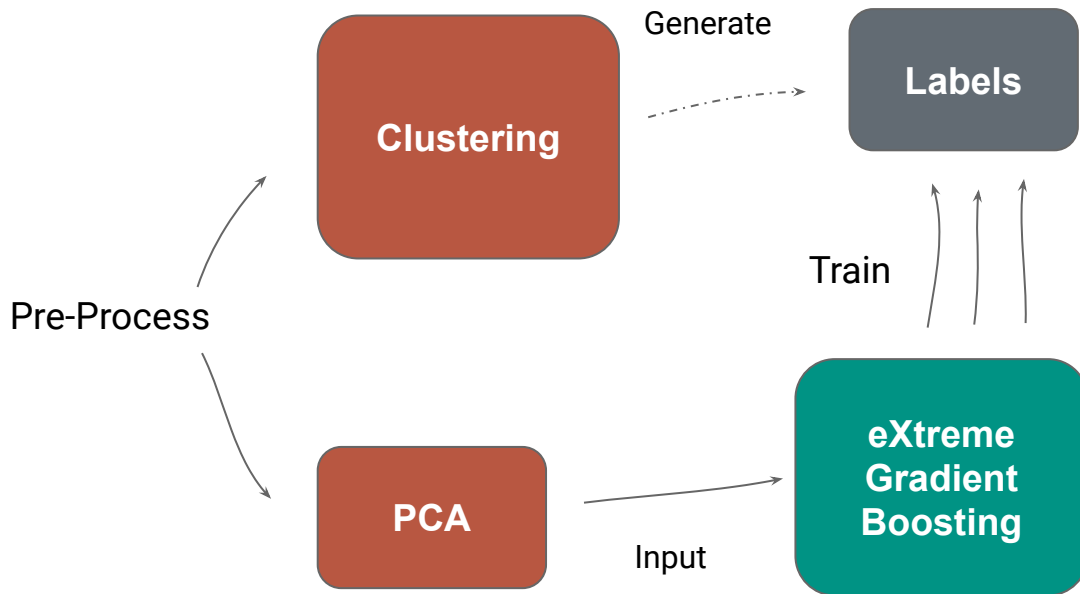

The Task

To predict if caregivers
would use caregiver
services

Building the Predictive Model

Model

- *Unsupervised Learning*
 - Clustering: Generate labels
 - PCA: Derive principal components as input variables
- *Supervised Learning*
 - XGB: Train and tune the predictive model

Results and Analysis

	NA	U
<i>Predicted</i> NA	729 (65%)	76 (33%)
<i>Predicted</i> U	397 (35%)	152 (67%)

- 67% correct on respondents who used services
- 65% correct on respondents who did not use services

This means:

- ❖ 33% of respondents who would use the services are missed
- ❖ 35% of respondents who would not use the services are wrongly classified

Implication?

Challenges & Future Directions

Challenges

- Matching data with specific use cases
- Treating the data right

Future Directions

- Explore new ideas for capturing data
 - Semi-supervised learning methods
- Combine insights from other research methods
 - Eg., NLP models for FGDs
